Silvia Hernández

**Payment Manager For
Mojaloop**

ModusBox,
Product Manager

Mojaloop's Mission

Increase financial inclusion by empowering organizations creating interoperable payments systems to enable digital financial services for all

To achieve this mission

- the cost of running a Hub needs to be reduced to make it an attractive proposition
- there needs to be mass adoption of participation within a Hub

How to increase adoption

Costs can be greatly reduced by supplying tools that enable a DFSP's ongoing participation. These tools should bring operational efficiencies, including a simple to use UX and thus reduced effort to complete tasks.

These tools include having a simple repeatable onboarding process.

Payment Manager solves these problems and has reduced the time for connection with both Mowali and UNCDF. Within the UNCDF project a MFI technically onboarded within a week.

Including smaller DFSPs with a minimal support team and low transaction volumes into a real-time payment network is difficult without creating risk or cost centers. Payment Manager solves this problem with it's slew of operational efficient solutions.

Simplifying the Onboarding Process Participation

laC simplifies the creation of an environment. laC turns deployment into a simple repeatable process. This helps reduce complexities often found in onboarding and operation management.

The steps involved are:

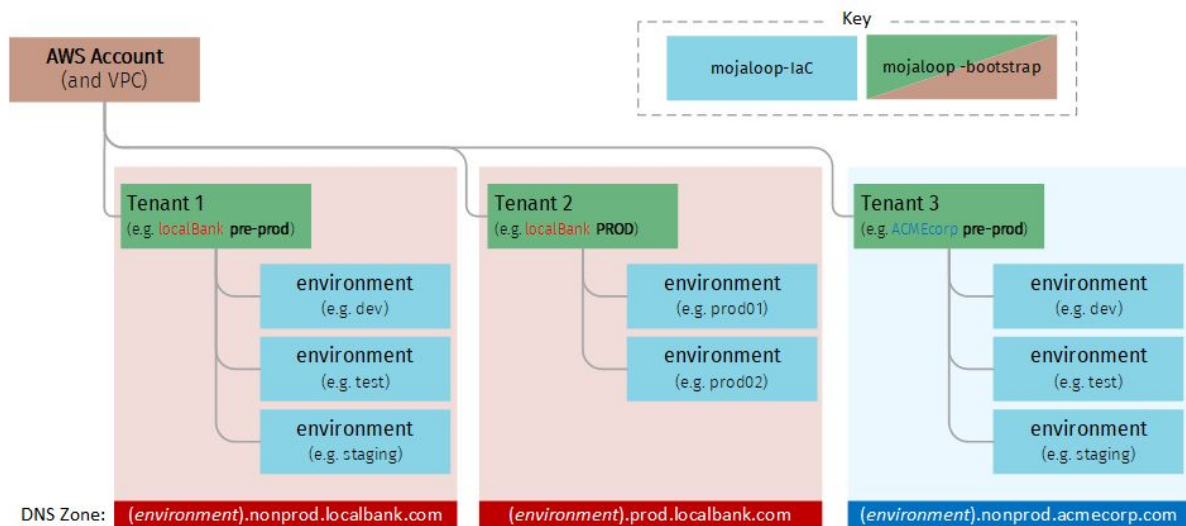

Deploy a Lab 1/2

The starting point of any DFSP connecting to the Hub is creating an environment to interact with and validate configuration, backend, changes, etc. Using IaC a secure deployment can be achieved very quickly.

Mojaloop IaC builds the infrastructure to run a production like deployment of Mojaloop in a Cloud environment. It is architected to be cloud agnostic and support on prem, with an initial implementation that works on AWS.

Along with Mojaloop, the IaC deploys API Gateway, Identity management, Monitoring, Altering, Secrets Management, Dependency caching, Simulators and can automatically execute Golden Path tests.

1/2 Deploy a Lab

laC deployment [Link](#)

This model has three objectives:

1. Consistent repeatable deployments of Mojaloop and supporting services.
2. To have a high degree of reusable code regardless of deployment environment (i.e. Cloud Provider or on prem).
3. Flexibility about number and purpose of each environment

Add Simulators

Next we add DFSP simulators to the lab.

This will enable a newly participating DFSP to complete their integration with the Hub much quicker than is currently possible as it provides a network to interact with like in a live environment.

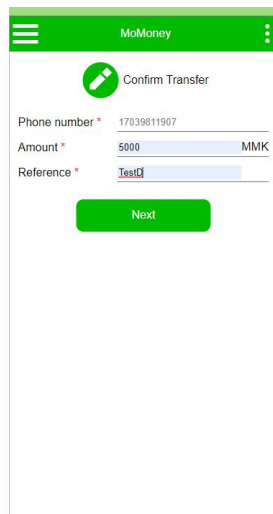

The simulators enable DFSPs to :

- Validate their own integration in a self service way, which speeds up the time to go live.
- Debugging is more efficient as the user friendly Simulators assist integrators / developers in finding and fixing issues as they arise thru the tools provided to check messaging between different parties involved

Add Simulators 2/2

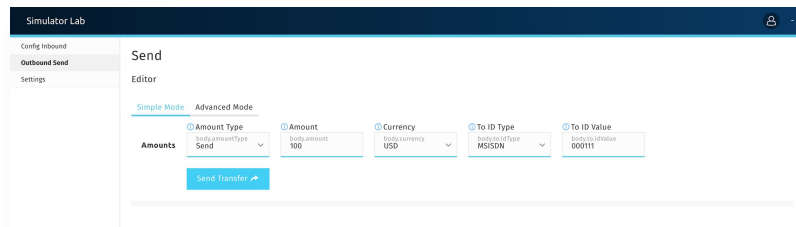

There are interfaces options to interact for simulators

App Simulator

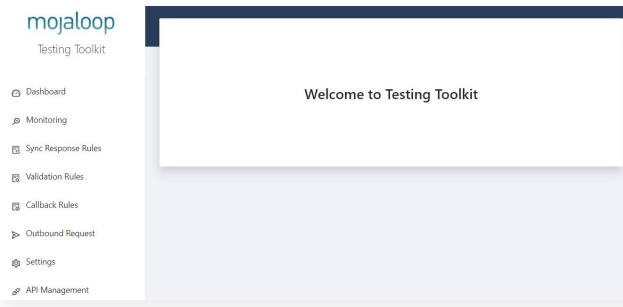

The App Simulator interface for MoMoney shows a green header with a menu icon and a 'Confirm Transfer' button. Below the header, there are input fields for 'Phone number *' (17039811907), 'Amount *' (5000 MMK), and 'Reference *' (Test1). A green 'Next' button is at the bottom.

Simulator UI

The Simulator UI interface for Simulator Lab shows a dark blue header with a user icon. Below the header, there are tabs for 'Config Inbound', 'Outbound Send', and 'Settings'. The 'Send' section is active, showing a 'Simple Mode' and 'Advanced Mode' toggle. The 'Amounts' section has a dropdown for 'Amount Type' (Send) and a 'Send transfer' button. The 'Advanced Mode' section has fields for 'Amount' (100), 'Currency' (USD), 'To ID Type' (MSISDN), and 'To ID Value' (000111).

Testing toolkit

The Testing toolkit interface for mojaloop shows a dark blue header with the 'mojaloop' logo and 'Testing Toolkit' text. Below the header, there is a sidebar with a list of navigation items: Dashboard, Monitoring, Sync Response Rules, Validation Rules, Callback Rules, Outbound Request, Settings, and API Management. The main content area displays 'Welcome to Testing Toolkit'.

Connect to the Hub

When a DFSP wishes to connect to the Hub the connection wizard simplifies and automates certificate creation and the configuration of the connections required to different environments.

- The wizard uses security best practices, which is vital to give people trust in the system.
- The process is repeatable so brings efficiencies, which in turn means lower upfront costs and quicker to market.

Monitoring & Operations

Supplying tools to enable a DFSP's ongoing Participation

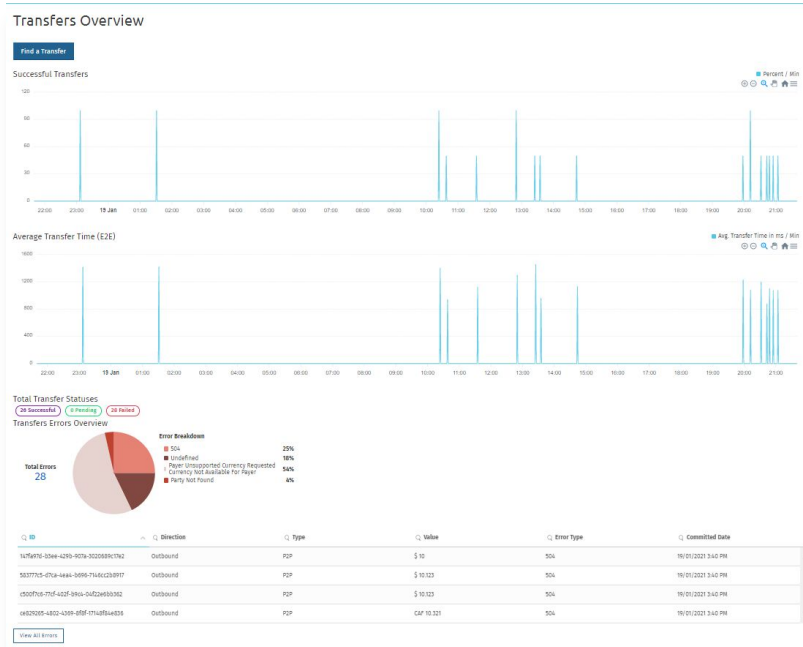

In order to effectively run a business the DFSP needs access to real time data. Payment manager provides tools that brings operational efficiency, improving the user experience and reduce the effort to complete different tasks independently.

These tools:

- Provide real time business & technical insights that enable predictive support and monitoring
- Allow speedy detection of any issues and the ability to identify where actions are needed
- Show a real time view of cash-flow and liquidity

Monitoring - Transfers

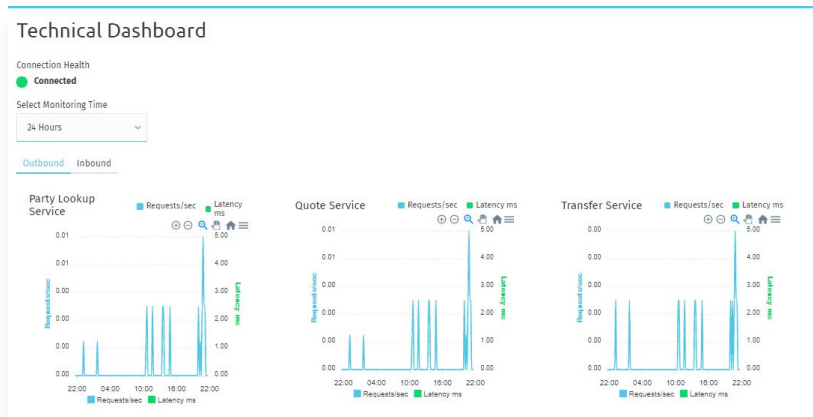

Transfer overview

- Overall transfers status
- Error report to identify if there are actions required
- Specific transaction general and technical information

Monitoring - Services

Service Monitoring

- Services monitoring
- Customizable monitoring time
- Prometheus Statistics

Monitoring - Positions

Business overview (roadmap)

- DFSP Position monitoring
- Flows monitoring from DFSP Perspective

Settlement Pilot UX

Financial Portal provides the Hub an interface to make the settlement a quick and easy process. You are able to close windows at any time and settle one or multiple windows in a single step.

PM4ML Connection Wizard

Secure DFSP Onboarding

PM4ML Product Roadmap

PM4ML Features

Mojaloop Connector	Integrated SDK and connection components to manage certificates and endpoints to establish a secure communication and exchange this information with the Hub
Connection Wizard	UX guide to complete the information and files that are needed by the Mojaloop Connector
Transaction Overview & Technical Details	Transfer dashboards with general transaction status information and access to technical details for specific transfers
Technical Dashboards	Services statistics to provide information about the availability for inbound Lookup, Quotes and Transfer Services from the DFPS point of view
TLS Certificates auto-configuration	Automatically configure TLS In Server and Out Server certificates for a secure communication

Thank you
